

ICCRTS 2005

Paper #373

“Applying a Unique Approach in a
USJFCOM Joint Experimentation (J9)
Rapid Assessment Project for
Operational Net Assessment (ONA) Data
Integration”

Gavin Robertson, CTO, WhamTech, Inc

Agenda

What is WhamTech's virtual data integration product (called EIQ Server®)?

EIQ Server vs. other data integration methods

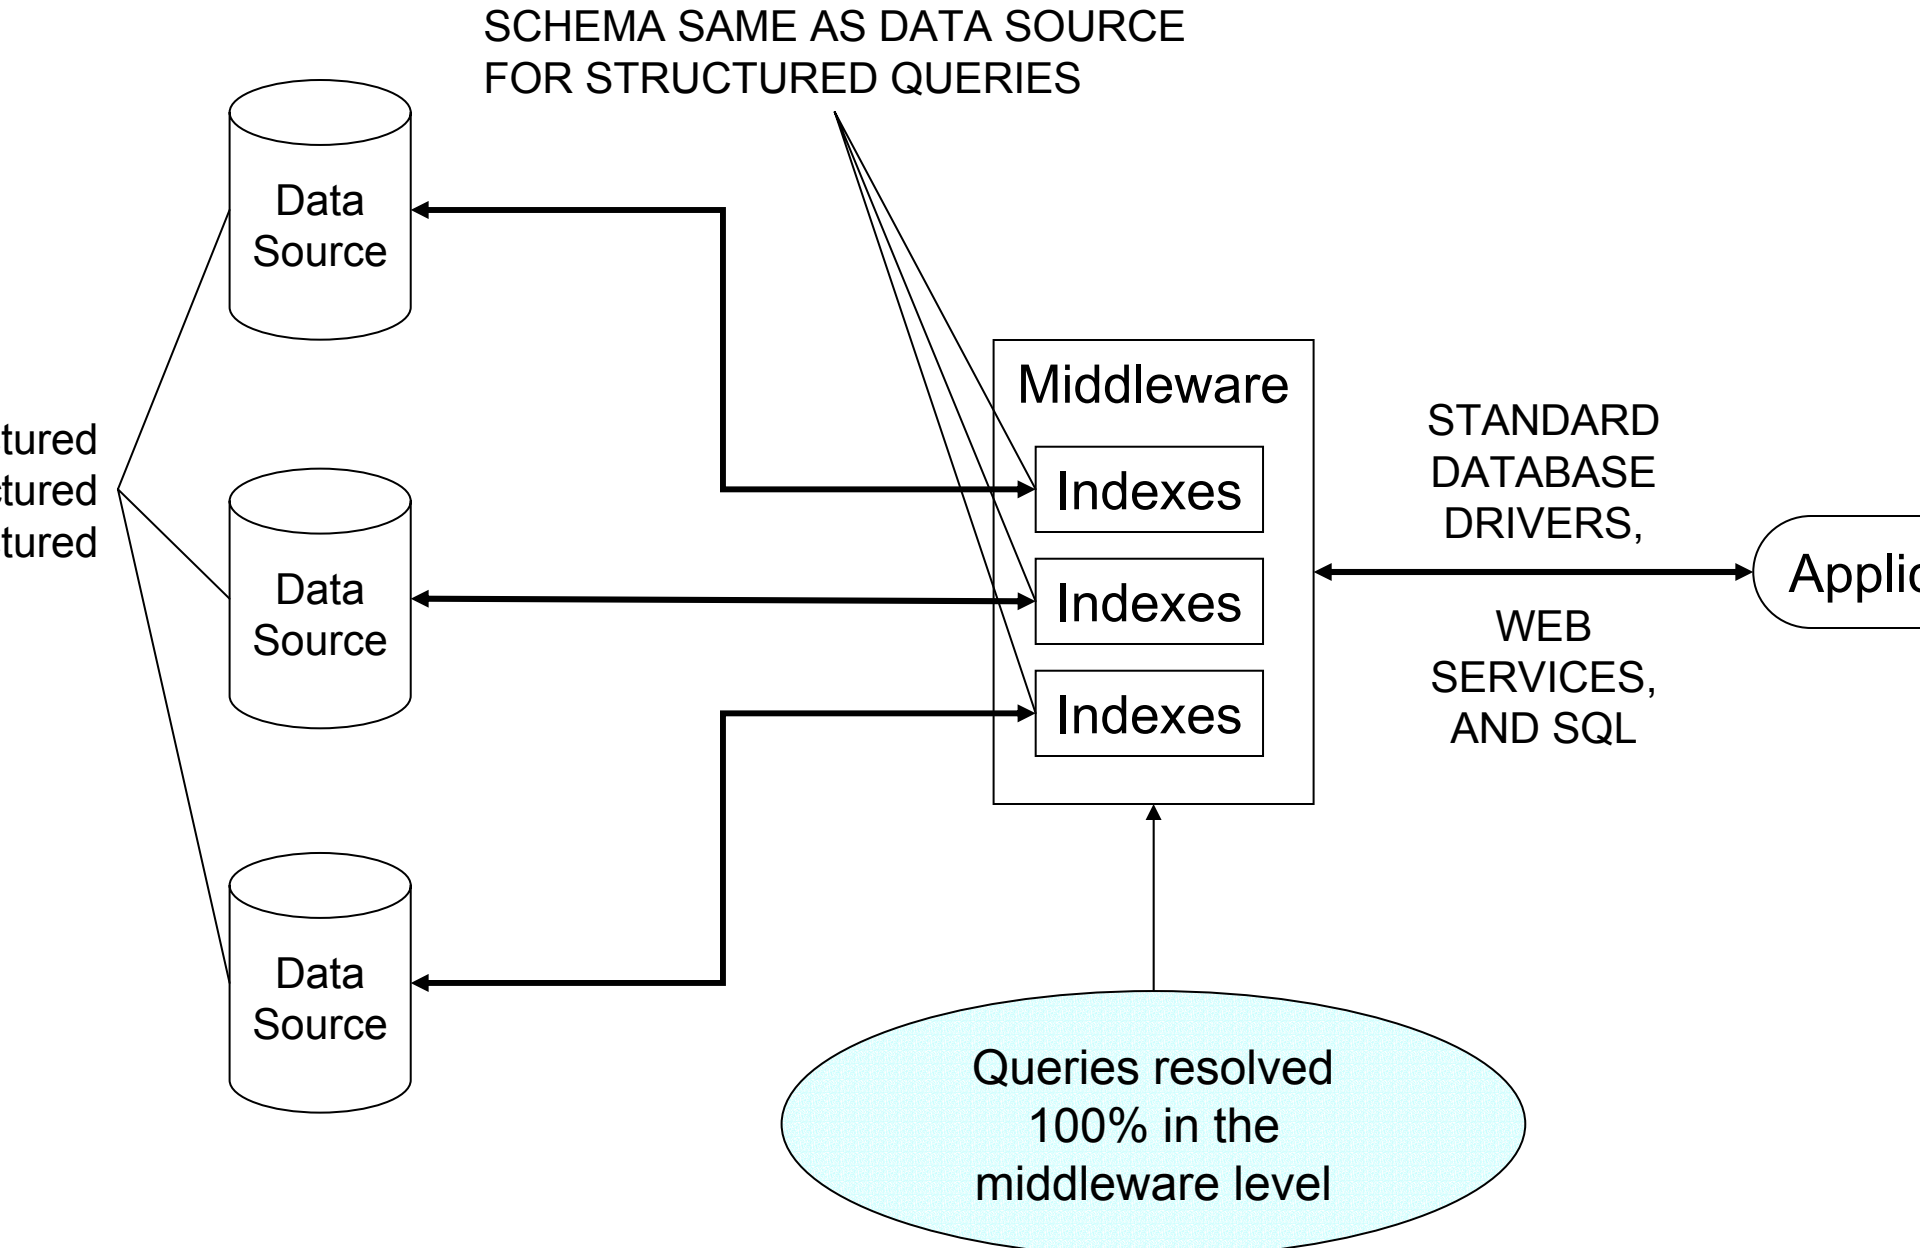

USJFCOM Project Description

Conclusions

Recommendations

Questions

ETQ Server

ELQ Server

CONS

Data warehouse performance

- Find almost 100% of data vs. “up to 50% not found” in federated systems
- Indexes/results clean and usable
- Complete control over indexing and query processing
- Consistent and multiple indexes across disparate data sources

Data remains at source

No major data and schema transforms

No federated adapters or specialized connectors

Almost any data source

Highly flexible

Security and metadata managed in middleware

Almost no load on data source system

PROS (continued)

- Data source system/owner unaware of queries
- Index monitoring agents feed subscriptions
- Fast
- Connect to data sources “as usual”
 - Security
 - Data updates – two-way

CONS

- Establishing index updates
- Indexes require storage

Basic Project Description

The project lasted over three months in 200

- Five data sources selected out of eleven candidates
- DOD XML Metadata Registry was used for metadata
- Indexes were built and maintained external to the data sources
- SQL queries based on metadata including JOINS, range queries, and text search, were executed against the external indexes
- Pointers to result-set data were isolated, and...
- Results retrieved from data sources, integrated and presented in a standard format

Included Data Sources

DS1 – ONA SQL Server relational database and associated Word documents (structured and unstructured – static)

DS3 – TRACES, (stripped) patient medical records in an Excel spreadsheet (semi-structured – static)

DS6 – SEAS PMESII model results of simulating effects of a biological attack in two XML files (semi-structured static)

DS10 – Web documents from ONA-provided news Web sites (unstructured – batch/incremental update)

DS11 – RSS news feeds, including ONA-provided news Web sites (semi-structured – near real-time)

Excluded Data Sources

GTN database

ACTD Rosetta

Census data

NGA Fortune Cookie

FBIS Web site

Others

Reasons Data Sources Excluded

Access difficulties

- Even though unclassified, they resided on limited access systems

Owners were reluctant to allow

WhamTech to parse and index content

- Not necessarily a copyright issue, but more of a process issue

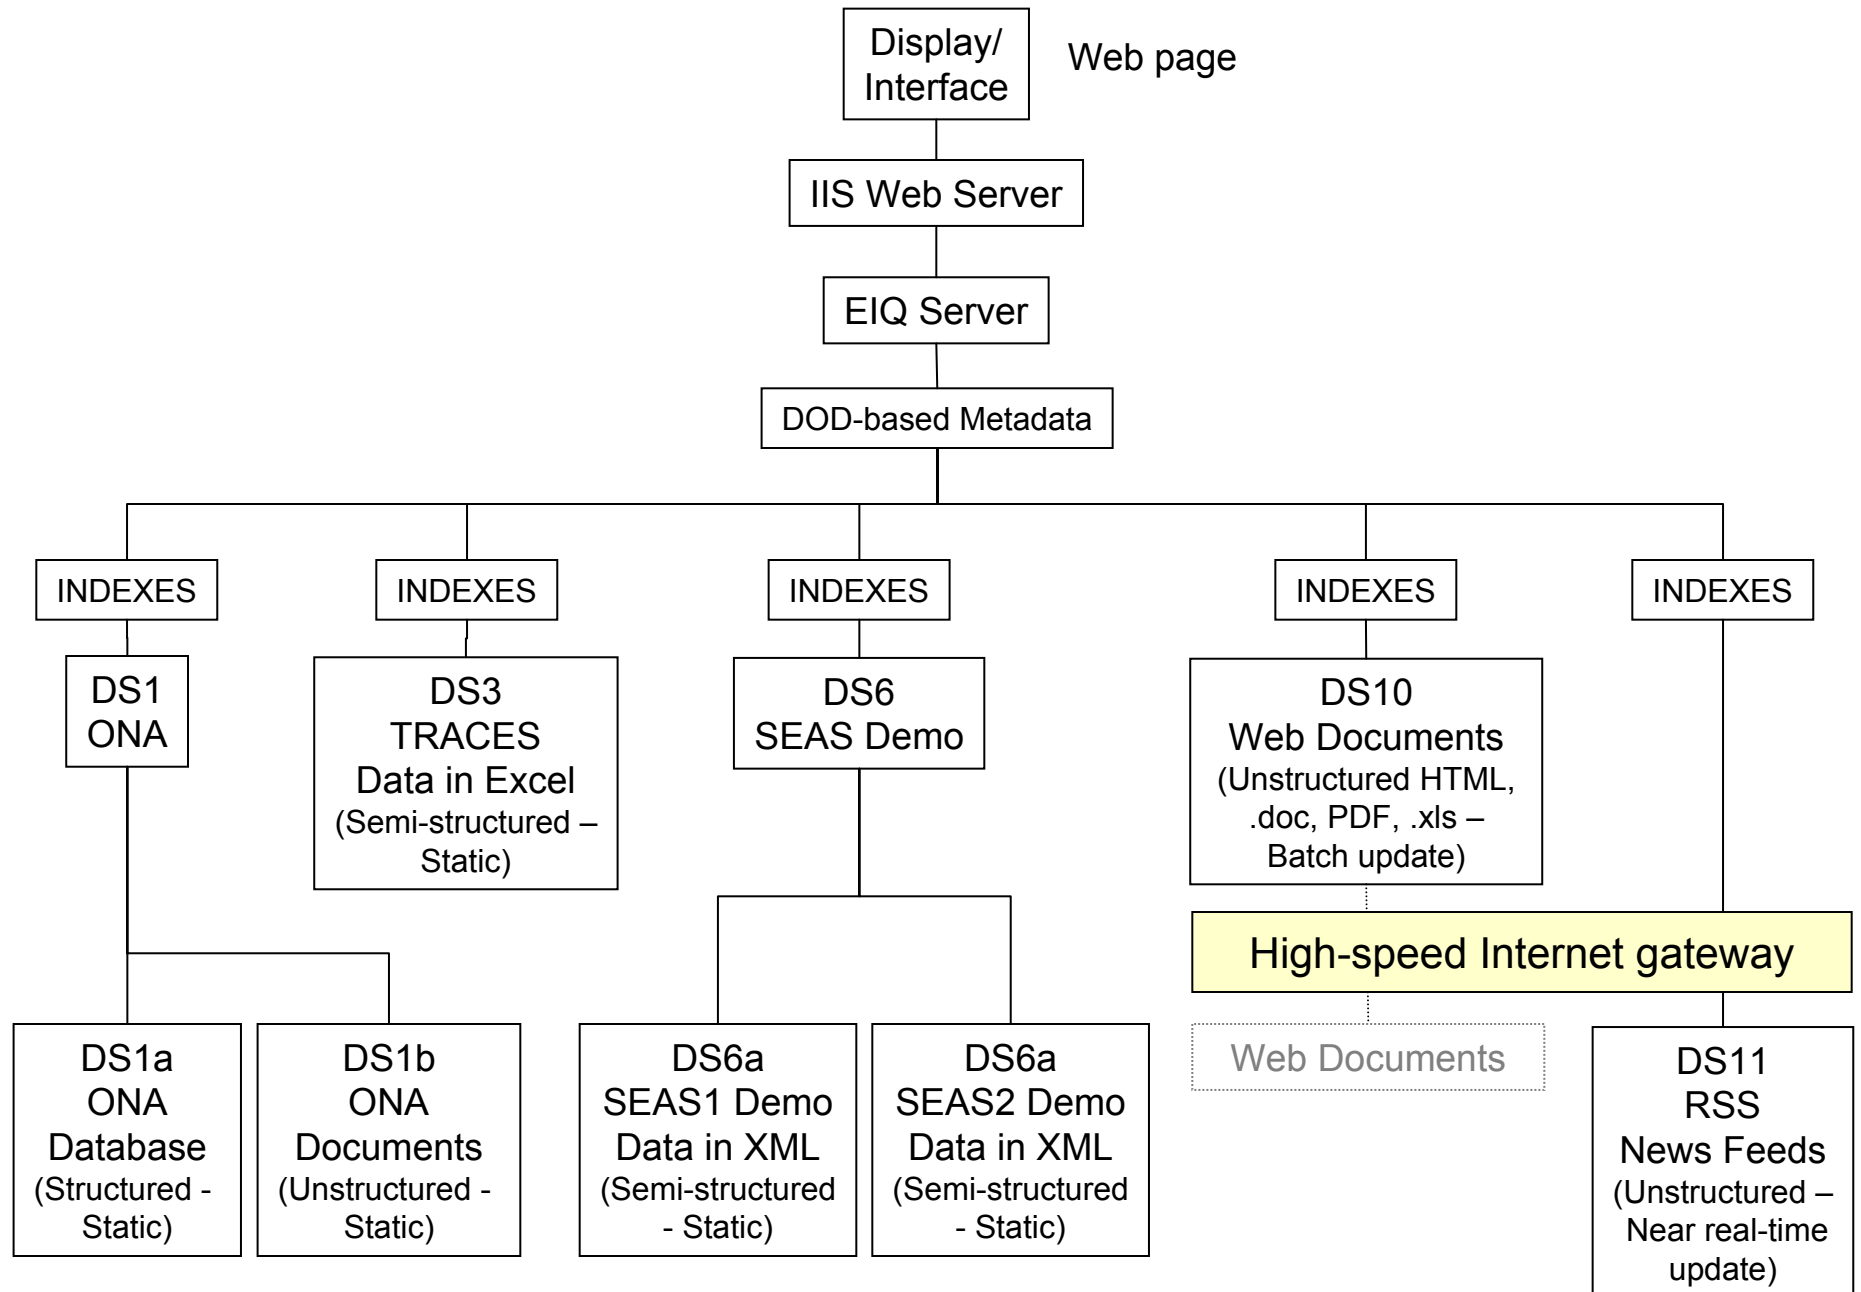

Data was so disparate that there was little or no commonality

Metadata

Access to the DOD XML Registry

- 30 separate metadata repositories
- Largest was TBD – “To Be Determined” - with over 14,000 data elements
- Of the 30,000+ data elements, a lot of redundancy (overlap)
- Able to use some (~25%) from COAL, GMI, IN PER, and TBD

Data Sources and Configuration

Basic Configuration Process

Register a data source

Build an index

Create a Virtual Data Source

- An index and registered data source pair

Create a Superschema metadata
result-set table containing a list of the
data and information of interest

Map data source fields to Superschema
metadata

and Unstructured Text Search

WHAMTECH

WhamTech USJFCOM ONA Pilot Project

Instructions:

1. Click the "Log in" button to enter your user ID and password
2. Type an SQL statement using one of the following method
 - I. Enter a new query
 - II. Choose (and change) a query from the drop-down menu
3. Click the "Query" button

For more information, please click on:

[Help](#)
[WhamTech Home](#)

United States
Joint Forces Command
Leading the way in transformation

Please select a SQL statement from the list...

```
select public_mood, country, node_military, document from mytable where node_military = '1' and country = 'vietnam' and contains("document,chemicals")
```

Pause after executing query and display the approximate number of records found [External Link Query](#)

Results format: HTML Spreadsheet XML ThinkMap

Query response	Result options
68 records found (approximately) in 0.562 seconds.	View <input type="button" value="First 50"/> records. Click <input type="button" value="Show results"/> to see the results.

Done Local intranet

Wham Tech Conclusions

As an unclassified experiment, access to data sources was restricted or not a high priority

- Should not be the case in deployment

Cultural barriers to sharing reflected in a few data source owners' responses

Within DOD, a plethora of metadata dictionaries

- None for ONA

More than one metadata dictionary needs to be mapped to same data

More than one metadata mapping WITHIN same metadata dictionary

Need to accommodate variations in so-called standard DOD data

Could probably use results level indexing instead of data level indexing with ONA and other complex or restricted access data sources

Novel approach to Excel and XML files, enabling standard drive and SQL access to data as though database tables

COM J9 Project Alpha Conclusion

Unique approach to data integration

Well suited to the ONA process, EBO, JC2, CIE, TIA, HF, and outside DOD in DHS, Intel and law enforcement agencies

Advantages over data warehousing and federated database approaches

Despite constraints, able to integrate disparate data sources in real-time

- Represents an opportunity for ONA analysts to focus analysis than data and information gathering

Real benefits go beyond time savings...allows the analyst to accomplish more than current processes allow

Develop a “best of” global common metadata dictionary for data integration and sharing, e.g. Esperanto

- Don’t force all to adopt – allow application organizations, and countries to continue with own metadata and language
- Map data sources to it
- Map applications to it

Need for ONA metadata dictionary and/or terms

nam I ech Recommendations (2 of

In an integrated ONA system:

- ONA database as source of query/search terms
- Other systems used as source for the ONA database
- Entity extraction extremely valuable to ONA
- Other KM tools such as semantic reasoning, categorization, a summarization
- Closer to near real-time Assessment - > Planning -> Execution > Assessment loop (EBO)
- Real-time, interactive visualization could add significant value ONA
- Closer tie-in to business process management
- Multiple ONA systems could be integrated and shared at a higher level
- The communities of interest (COI) approach would seem to lend itself to ONA and EIQ Servers running ONA
- Multiple COI systems could be integrated and shared at a high level

COM J9 Project Alpha Recommendation

Novel nature of EIQ Server warrants further investigation and integration

EIQ Server approach for other areas than ONA

Assistant Secretary for Defense for Networks and Information Integration to include EIQ Server as part of HF and a future Quantum Leap proof-of-concept experiment

WhamTech seek accreditation for EIQ Server use with classified data sources

Future Plans

Included in several federal and state agency, and commercial project proposals

Build on existing implementations as a turbo charger for RDBMSs and as a much-improved adapter in federated information sharing systems

Aim to allow almost any application to work with almost any data source

- Universal metadata management
- Universal interoperability
- Ultimate goal: **universal semantic interoperability**

Reviewing inclusion of Latent Semantic Indexing (LSI)

Improved entity extraction

Link Indexes

- Direct and indirect link analysis in middleware

Future EIQ Server System Architecture

Back to Questions?

Different Approach to Metadata Management

Index Updates

At least seven methods:

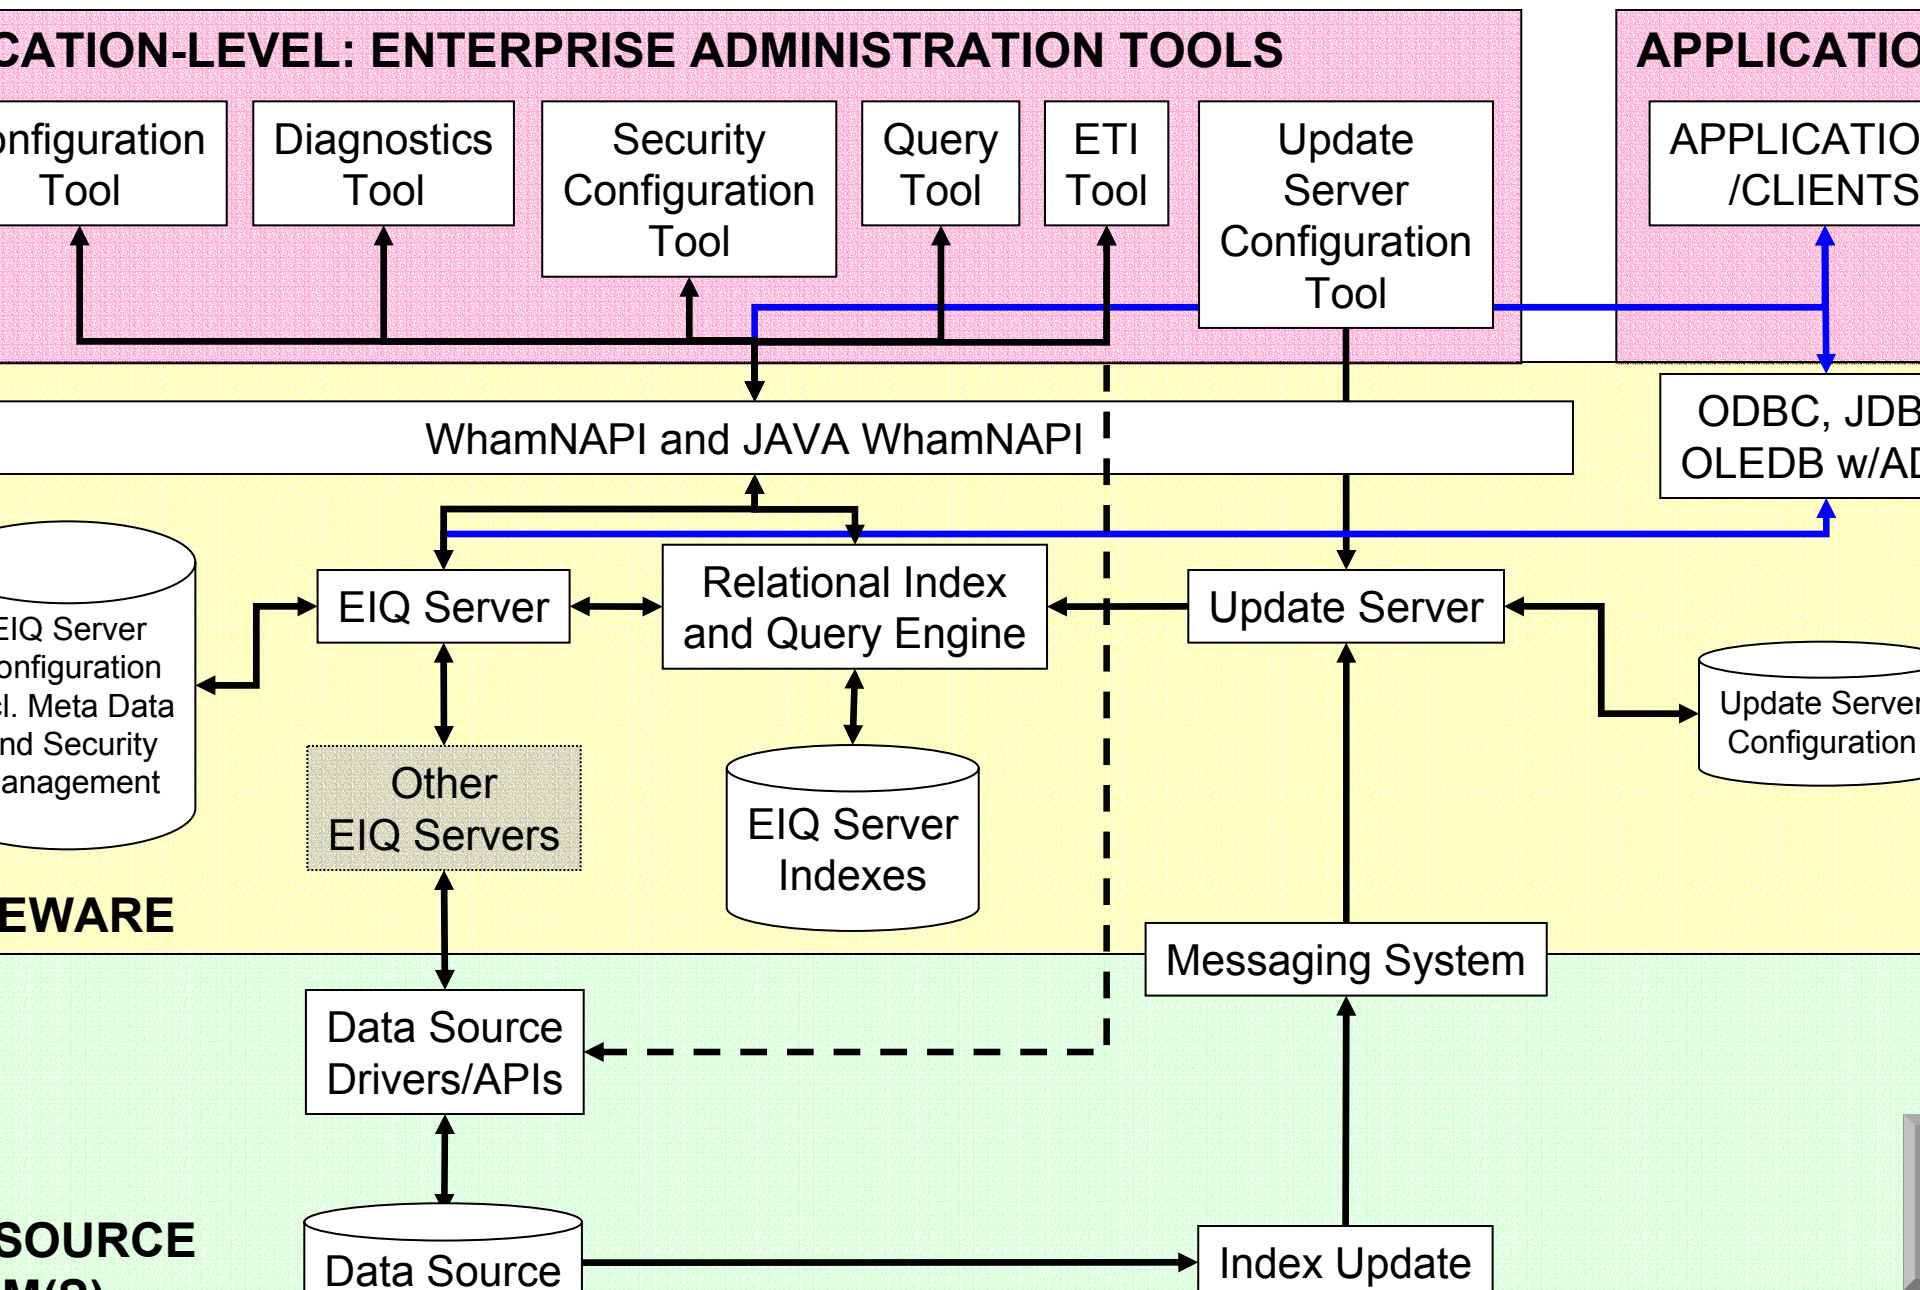

– Data level indexing:

- Batch
 - Complete refresh
- Incremental
 - Batch updates
- Transaction or change logs
 - Usually not on data source system
- Triggers
 - Usually install on data source system
- Message Queues
 - Tap into
- Existing replication/backup software
 - Use target as source

– Results level indexing

- Update rate and route depends on system
