# OVERVIEW

- DISCUSS ANTS COLONY AS AN EXAMPLE OF AN IDEAL NET-CENTRIC VALUE SYSTEM
- MAKE AN ANALOGY BETWEEN ANTS ADAPTIVE NETWORK AND DOD NETWORK FOR NET-CENTRIC SYSTEM
- DISCUSS THAT NETWORK SCIENCE IS AN EMERGING SCIENTIFIC DISCIPLINE AND THUS THE SCIENTIFIC CONCEPTS ARE NOT MATURED TO PREDICT THE NETWORK PERFORMANCE FOR NET-CENTRIC SYSTEMS
- DISCUSS TYPES OF NETWORK, PROPERTIES OF NETWORK, NETWORK CLASSIFICATION, AXIOMATIC DESIGN FOR NETWORK PERFORMANCE MODEL
- DISCUSS QUEUING MODELS AND C4ISR SoS DESIGN AS A PREREQUISITE FOR NETWORK PERFORMANCE MODEL
- DISCUSS INFORMATION CONTENT FOR NETWORK PERFORMANCE
- DISCUSS SERVICE-BASED SIMULATION MODELS AND EXPERIMENTAL TESTS
- CONCLUSIONS
- QUESTIONS

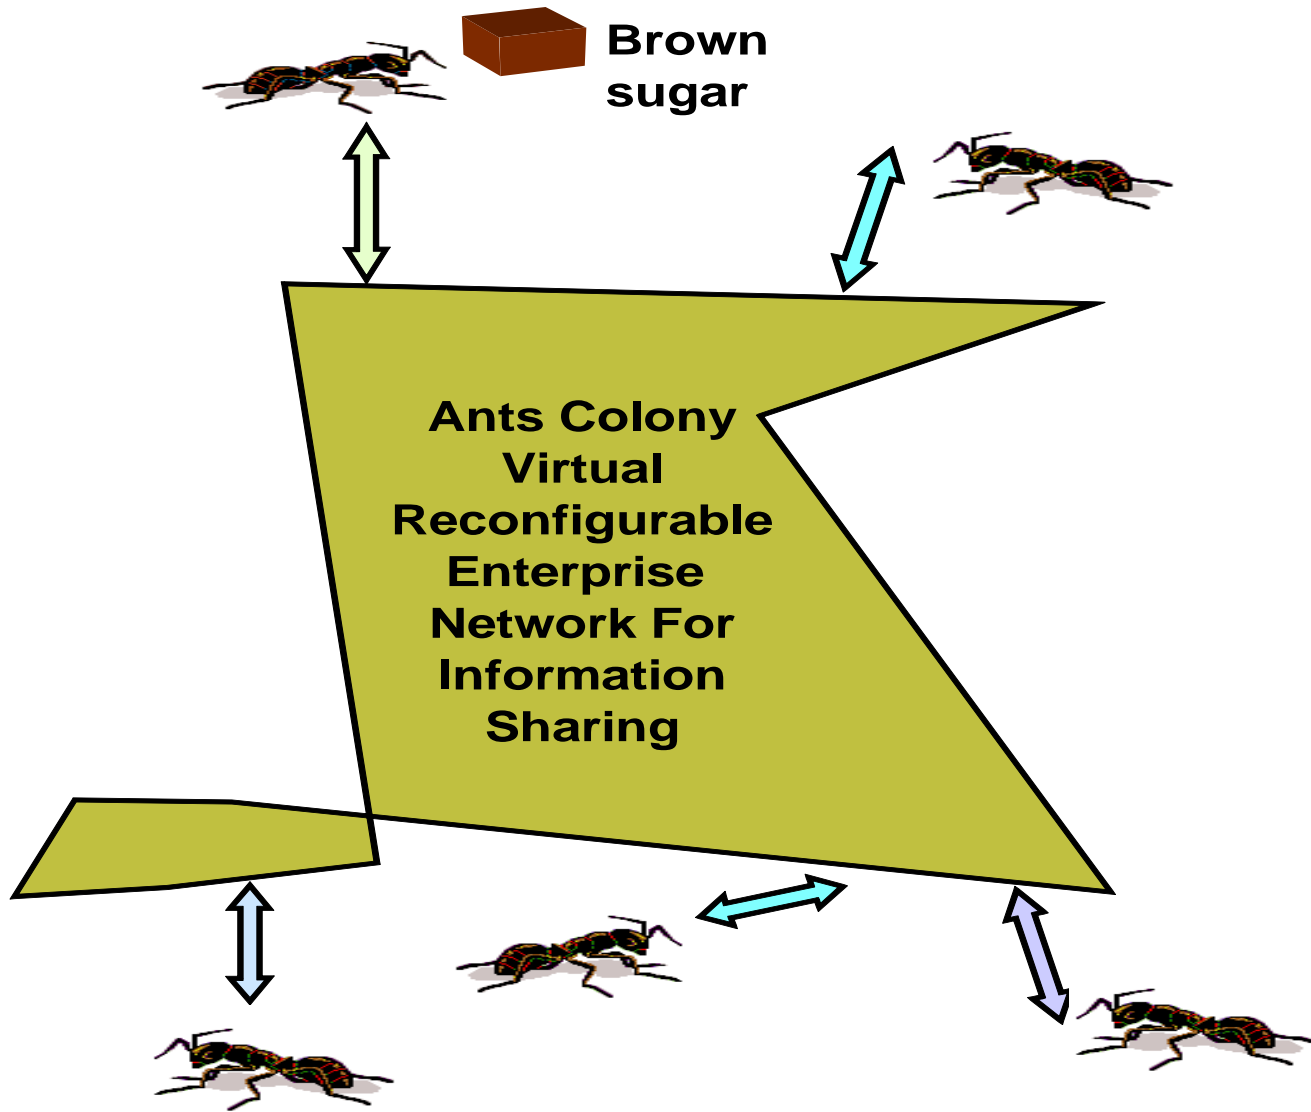

COMMAND (BUSINESS GOAL OR MISSION) and CONTROL (GAME PLAN) FOR ANTS COLONY

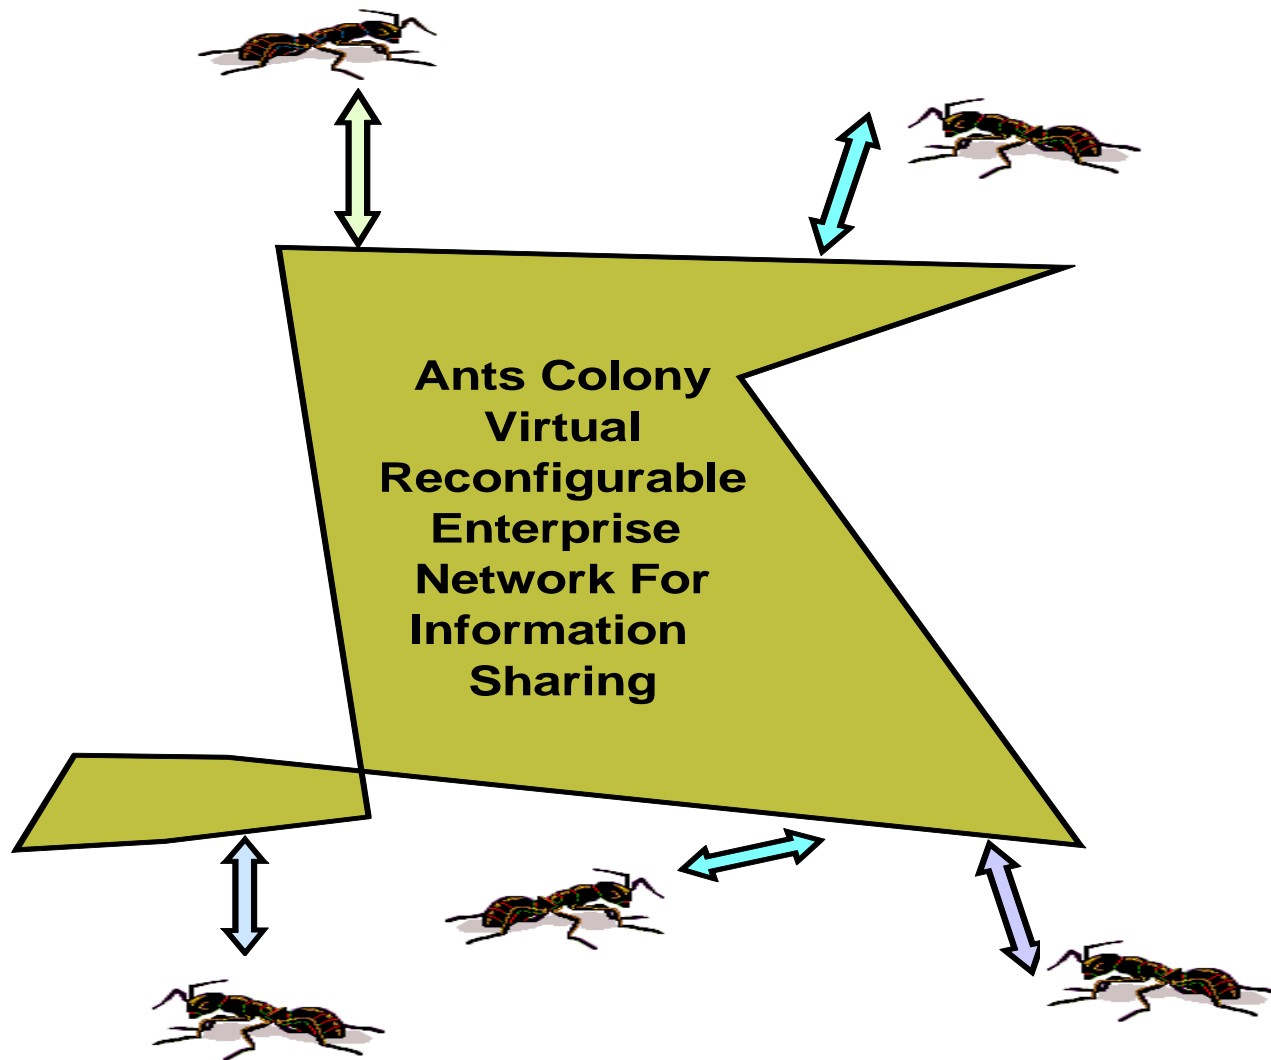

# ANTS ADAPTIVE NETWORK VERSUS NETWORK FOR NET-CENTRIC SYSTEM [ALBERTS ET AL. 2003.]

Ubiquitous Network and Services that support the "enterprise"

EXTREMELY CHALLENGING TO PREDICT THE PERFORMANCE OF SUCH AN ADAPTIVE NETWORK; SCIENTIFIC CONCEPTS ARE NOT MATURED FOR MODELING THE PERFORMANCE OF SUCH NETWORKS

# NETWORK TYPES

- Physical network
- Communications network, e.g., Internet
- Information network, e.g., Web portal, Joint Battlespace Infosphere (JBI)
- Cognitive network
- Social network

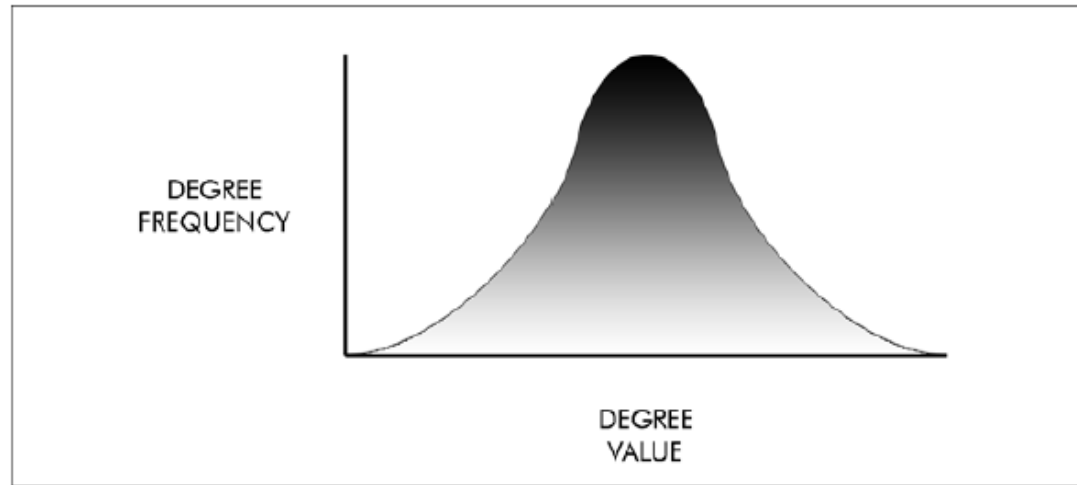

# PROPERTIES OF NETWORK

- *Average degree -- measures the average number of links connected to a node in the network*
- *Clustering coefficient -- measures how well the neighbors of a given node are linked in the network*
- *Average path length -- measures the average distance between two nodes of the network chosen at random*
- *A network with high average degree, high clustering coefficient, and a low average path length, will achieve overall best performance.*

# NETWORK CLASSIFICATION

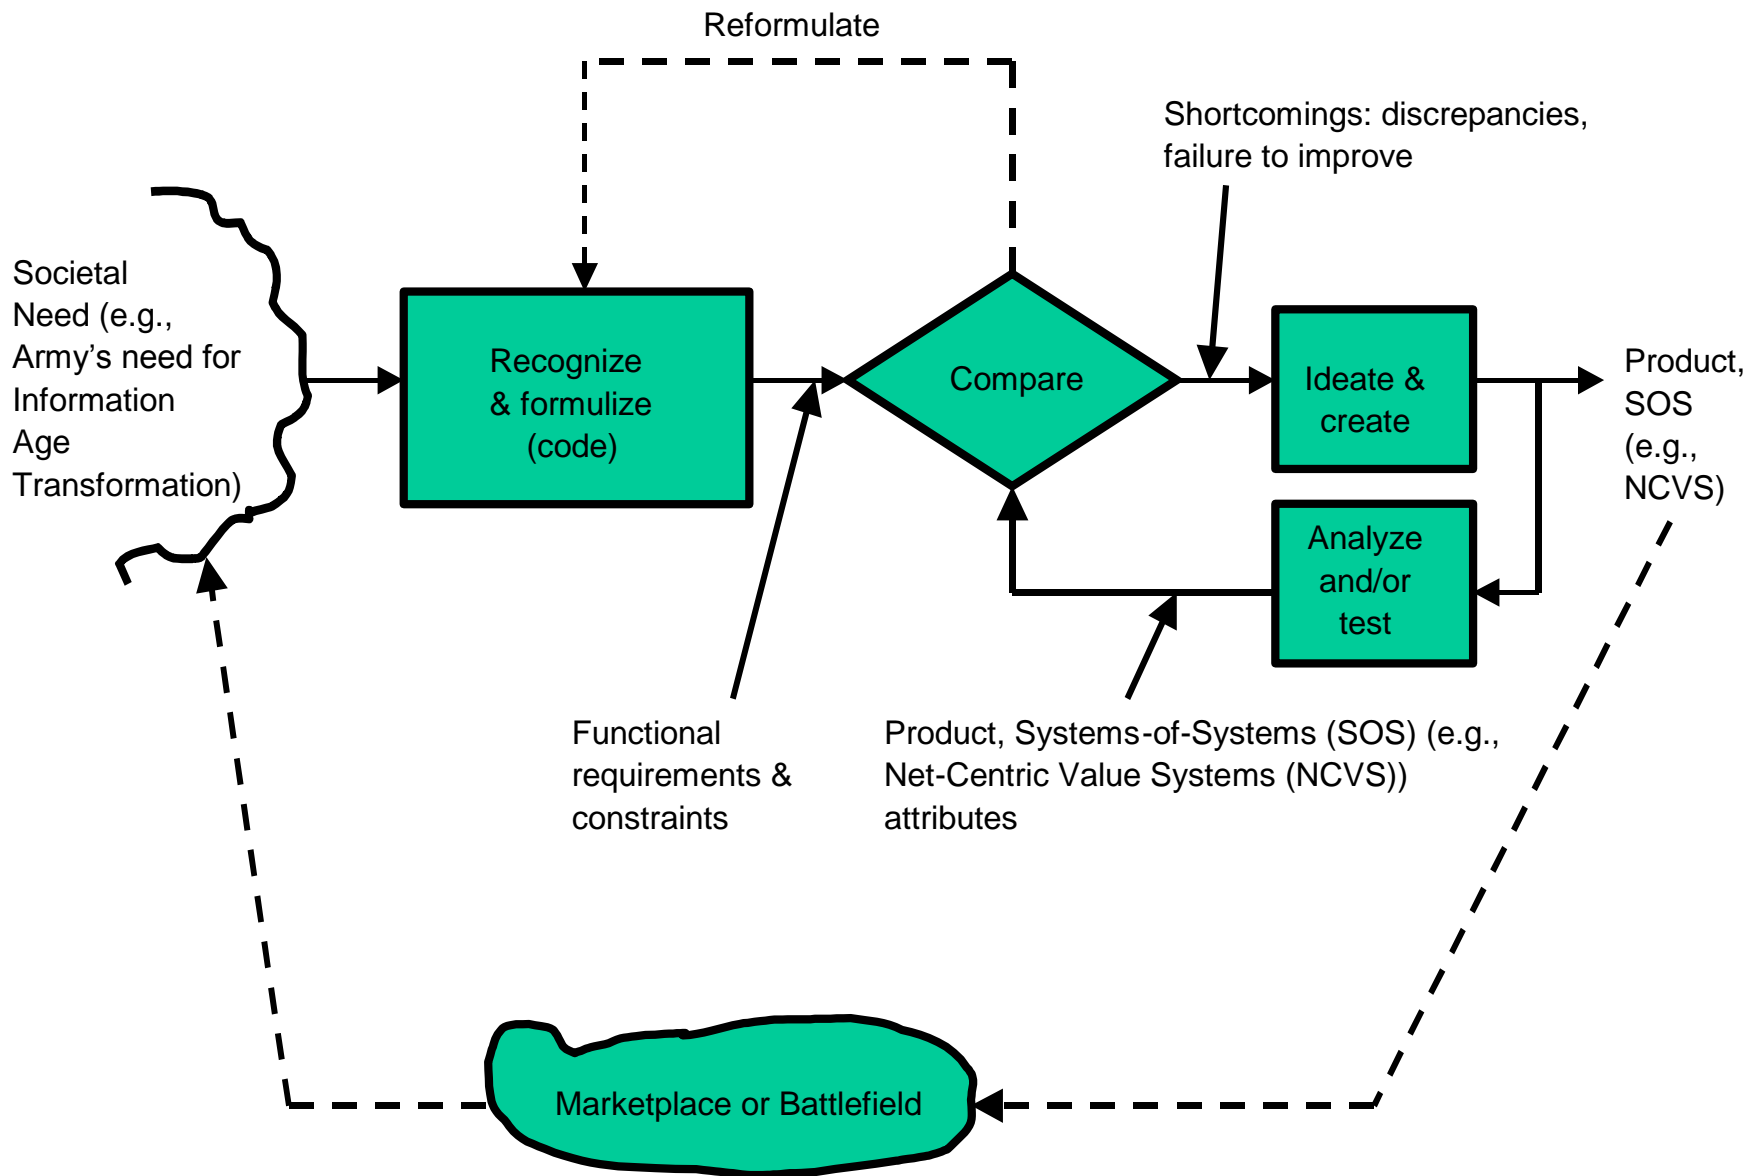

- Regular Networks, e.g., the retina of the eye and the roads of some large cities; average degree of all nodes assumes the same value
- Random Networks -- have low average degree, low clustering coefficient, and low average path length
- Small World Networks -- have high clustering coefficient, and high average degree
- Scale Free Networks, e.g., Internet; have high cluster coefficient, low average path length, and a few nodes with a high average degree
- Question: Which combination of networks (hybrid network systems) would be ideal for adaptive C4ISR SoS?

The Frequency Distribution of The Degree of A Random Network [Atkinson et al. 2005]

The Frequency Distribution of The Degree of A Scale-Free Network [Atkinson et al. 2005.]

The Design Loop-As the Architecture for Systems-of-Systems (e.g., Net-Centric Value Systems, Future Combat Systems, etc.) Design [Modified Version of Nyamekye et al., June 2005 (CD Version); Wilson, D. R., Ph.D. Thesis, MIT, August, 1980.]

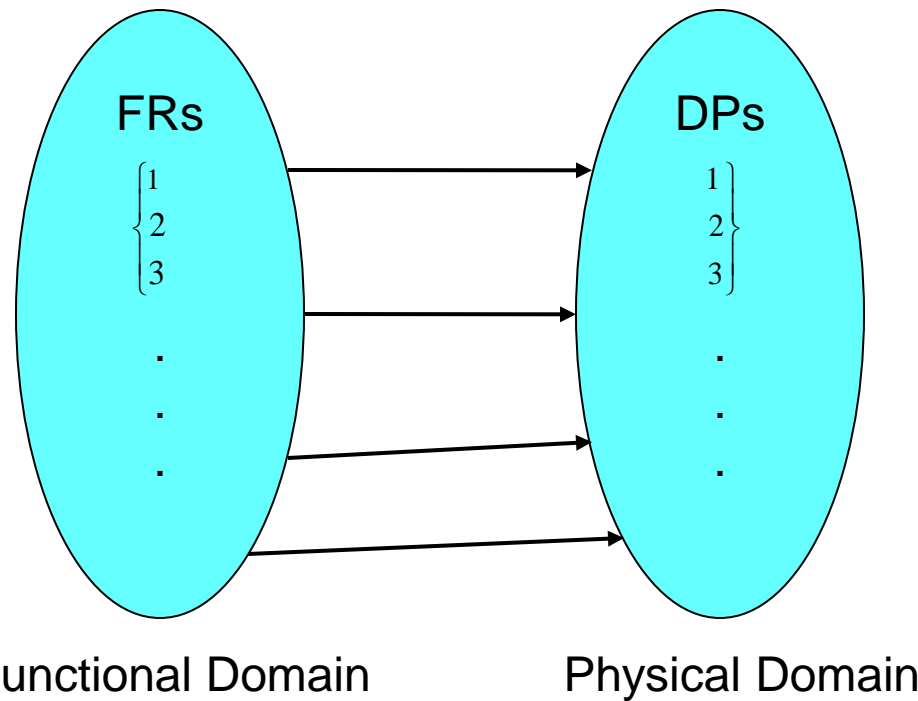

# BRIEF OVERVIEW OF AXIOMATIC DESIGN– SUH FROM MASSACHUSETTS INSTITUTE OF TECHNOLOGY (MIT)

## TWO AXIOMS:

**AXIOM 1:** In a good design, the independence of functional requirements (FRs) is maintained.

**AXIOM 2:** The design that has the minimum information content is the optimal design.

In addition to the functional requirements, a set of constraints may also exist. Constraints are factors that establish the boundary on acceptable design solutions. For example, some designers treat cost as a constraint. On the battlefield, how much collateral damage, and how many casualties are “acceptable” in a theater operation, could represent the constraints [Alberts et al. 2003]. Constraints are very similar to functional requirements in character and attributes except that the independence of constraints is not required in a good design. Note: AXIOM 2 is analogous to Shannon Information Theory.

Mapping from the Functional Domain (or Space) to the Physical [Suh 1990]

$$\{FR_i\} = [DM]\{DP_i\} \quad \dots \text{BASIC DESIGN EQUATION}$$

$\{FR_i\}$  = the vector that represents the functional requirements in the functional domain

$\{DP_i\}$  = the vector that represents the design parameters in the physical domain

$[DM]$  = the design matrix that relates  $\{FR_i\}$  to  $\{DP_i\}$

The figure below shows can and bottle opener. This device satisfies two objectives or functional requirements (FRs). The FRs are fulfilled by the following physical solutions or design parameters (DPs):

Goal 1 (FR1): Open cans; DP1: Can Opener

Goal 2 (FR2): Opens bottles; DP2: Bottle Opener

If the requirements are not to perform these two functions simultaneously, then this physically integrated device satisfies two independent goals or functional requirements (FRs). Otherwise coupling occurs if both goals must be concurrently met with the same device. We can use Corollary 1 to redesign the device to eliminate coupling, while fulfilling both FRs simultaneously, with both DPs.

**Another Example: Iraq Yusufiyah Case, June 21, 2006 – Major Caldwell CNN Transcript**  
<http://transcripts.cnn.com/TRANSCRIPTS/0606/21/sitroom.03.html>

Goal 1 (FR1): Engage and defeat the enemy; DP1: 1 vehicle convoy of 3 soldiers

Goal 2 (FR2): Call the support group; DP2: 1 vehicle convoy of 3 soldiers

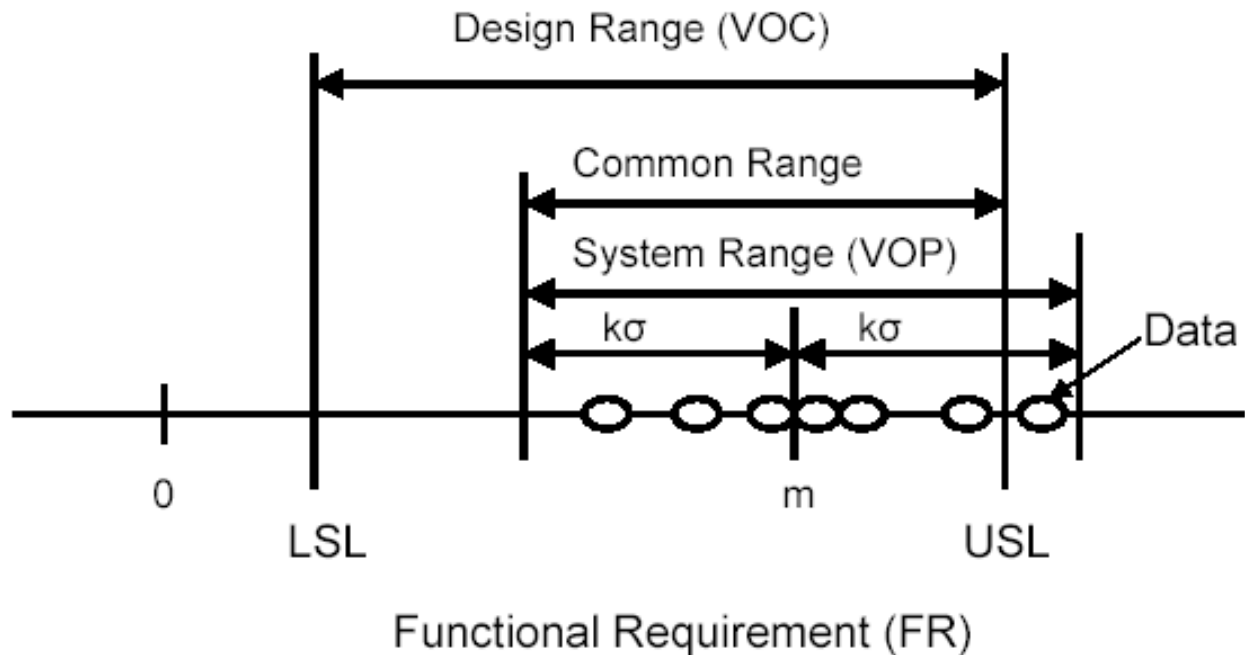

Equation 1

$$I = \log \left( \frac{\textit{system range}}{\textit{common range}} \right)$$

Equation 2

$$I_{\textit{value system or global system}} = \sum I$$

Experimental values for Functional Requirement [Nakazawa 2001]

LSL = Lower specification limit

USL = Upper specification limit

$k$  = a safety factor

$m$  = mean value of process performance

$\sigma$  = unbiased standard deviation of process performance

Illustration of Design Range and Common Range [Nakazawa 2001.]

I = Information Content (From AXIOM 2)

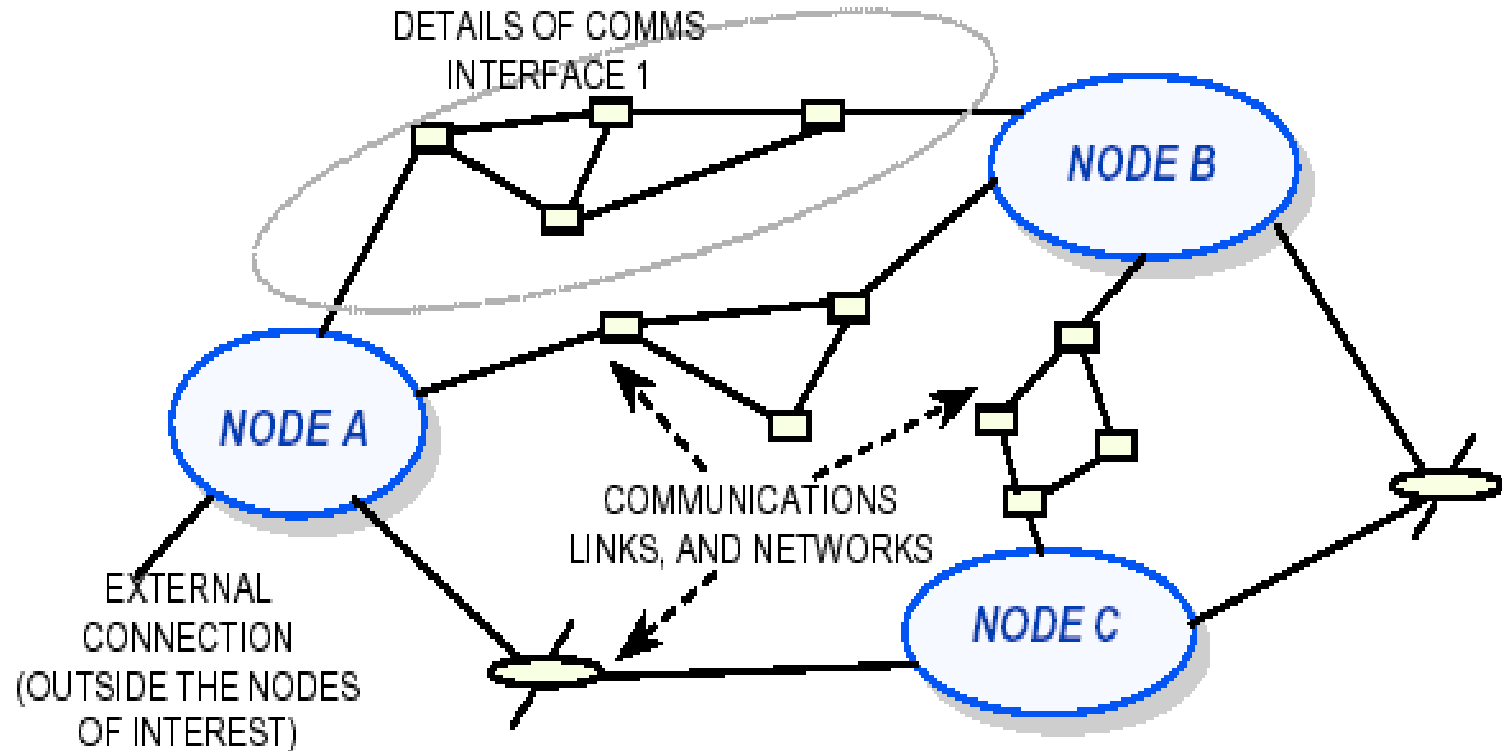

System Range = Voice of the Process (VOP)

Design Range = Voice of Customer (VOC)

Common Range = Amount of Overlap between VOC and VOP

Total Information Content, Equation 2.

# COMMUNICATIONS NETWORK FOR QUEUING MODELS

Systems Communications Description, Inter-nodal Version (SV-2) [DODAF Version 1.5, Volume II April 2007.]; Small boxes represent routers, and the oval shapes represent satellites.

# SUMMARY OF QUEUING MODELS FOR FUTURISTIC NET-CENTRIC SOS

## Equation 18

$$T = \frac{1}{\sigma_z} \left\{ \prod_{r=1}^{\text{deg}_z} (1 - K_r) \right\}^{\omega_r} + \sum_{i=1}^o \frac{\lambda_i}{\gamma} \left[ \frac{\frac{\lambda_i}{\mu' F_i}}{\mu' F_i - \lambda_i} + \frac{1}{\mu F_i} + \frac{L_i}{SP} + \frac{1}{\sigma_z} \left\{ \prod_{r=1}^{\text{deg}_z} (1 - K_r) \right\}^{\omega_r} \right]$$

$$g(C) = \frac{e^{a + bC}}{1 + e^{a + bC}} \quad \text{Equation 19}$$

$$T_C = \frac{T}{1 - g(C)} \quad \text{Equation 20}$$

# DESIGN OF C4ISR SYSTEMS-OF-SYSTEMS

- Power To The Edge can be applied in two ways for Integrated C4ISR SoS:
  - Design and architecture of C4ISR systems-of-systems (Infostructure)
    - COROLLARIES (DESIGN SCIENCE RULES) FROM AXIOMATIC DESIGN FOR C4ISR SoS
    - THEOREM M2 FROM AXIOMATIC DESIGN FOR C4ISR SoS
  - Organization and management of work (C2)

Among the corollaries and theorems derived from AXIOM 1 and AXIOM 2, the following four corollaries and a theorem, are essential for designing C4ISR SoS, namely [Suh 1990; Suh 2001]:

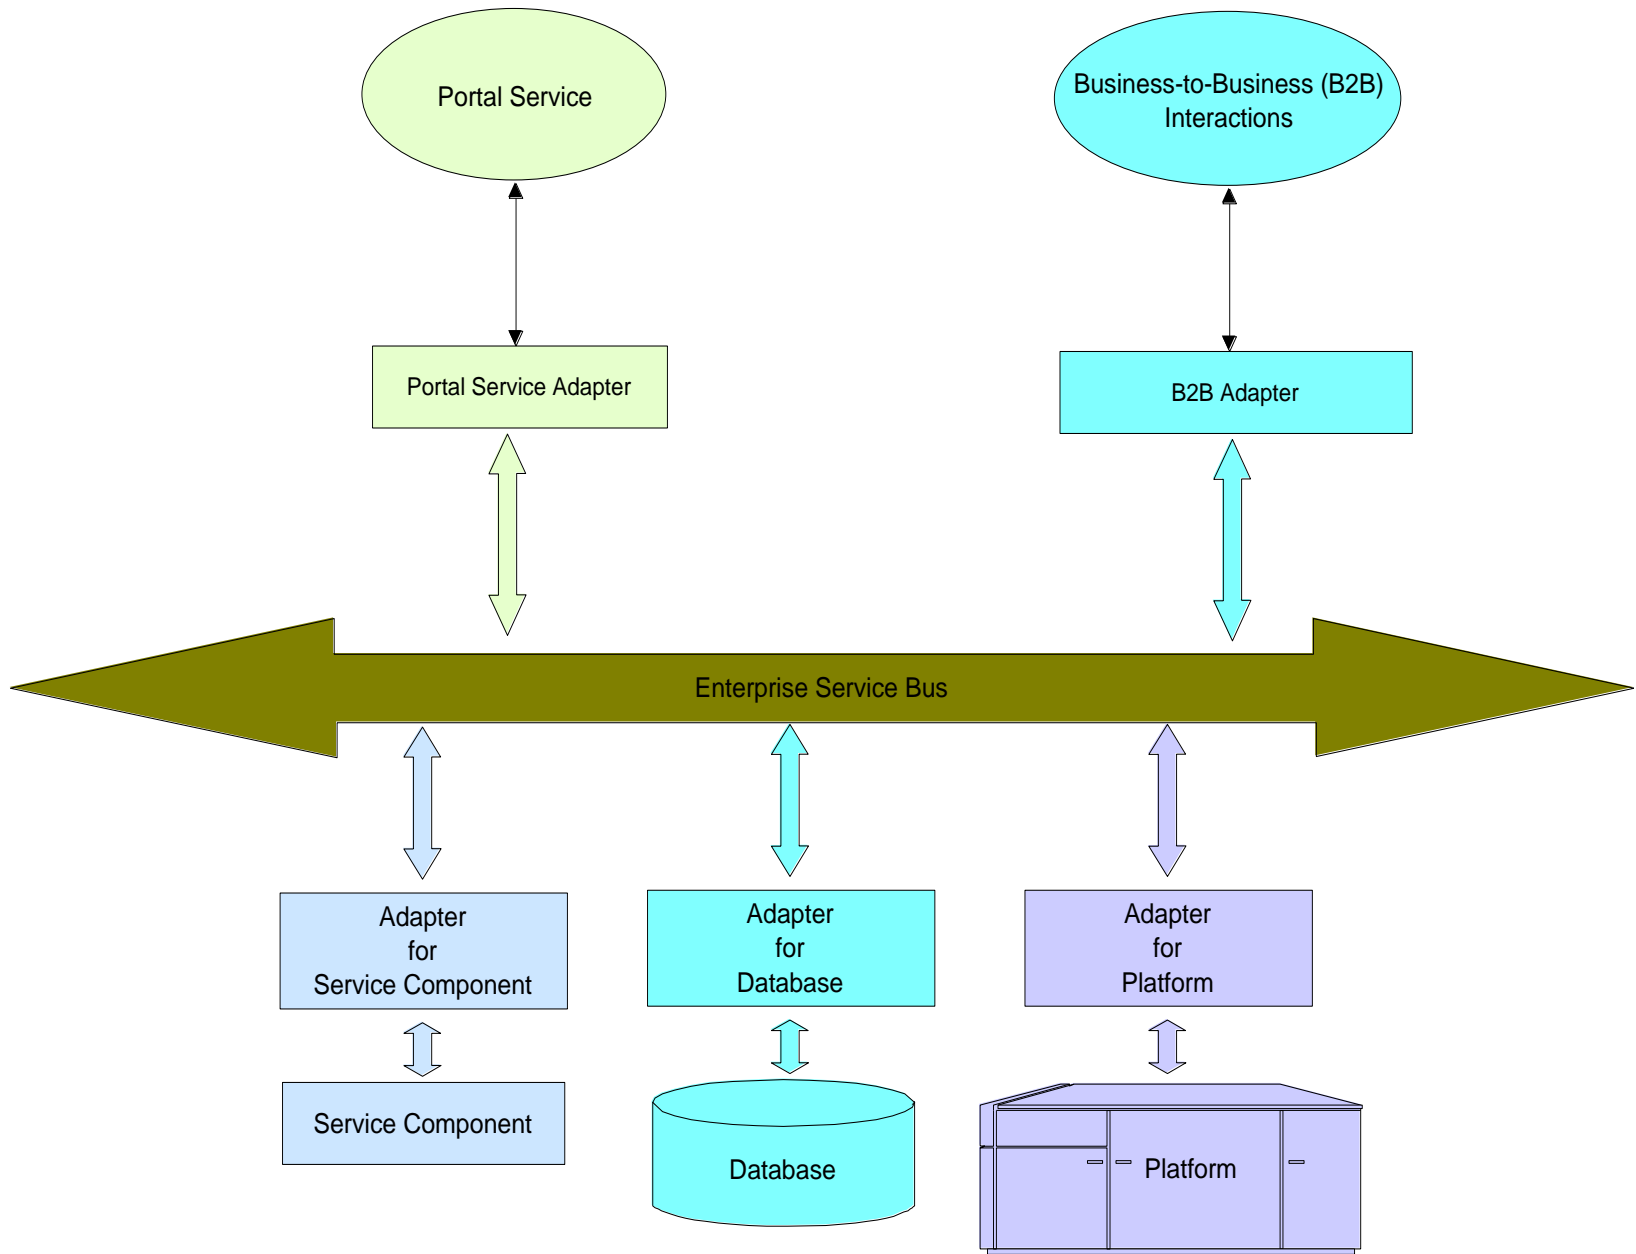

***Corollary 1: Decoupling of Coupled Design: Decouple or separate parts or aspects of a solution if FRs are coupled or become interdependent in the proposed designs.***

***Corollary 2: Minimization of FRs: Minimize the number of functional requirements and constraints. Strive for maximum simplicity in overall design or the utmost simplicity in physical and functional characteristics.***

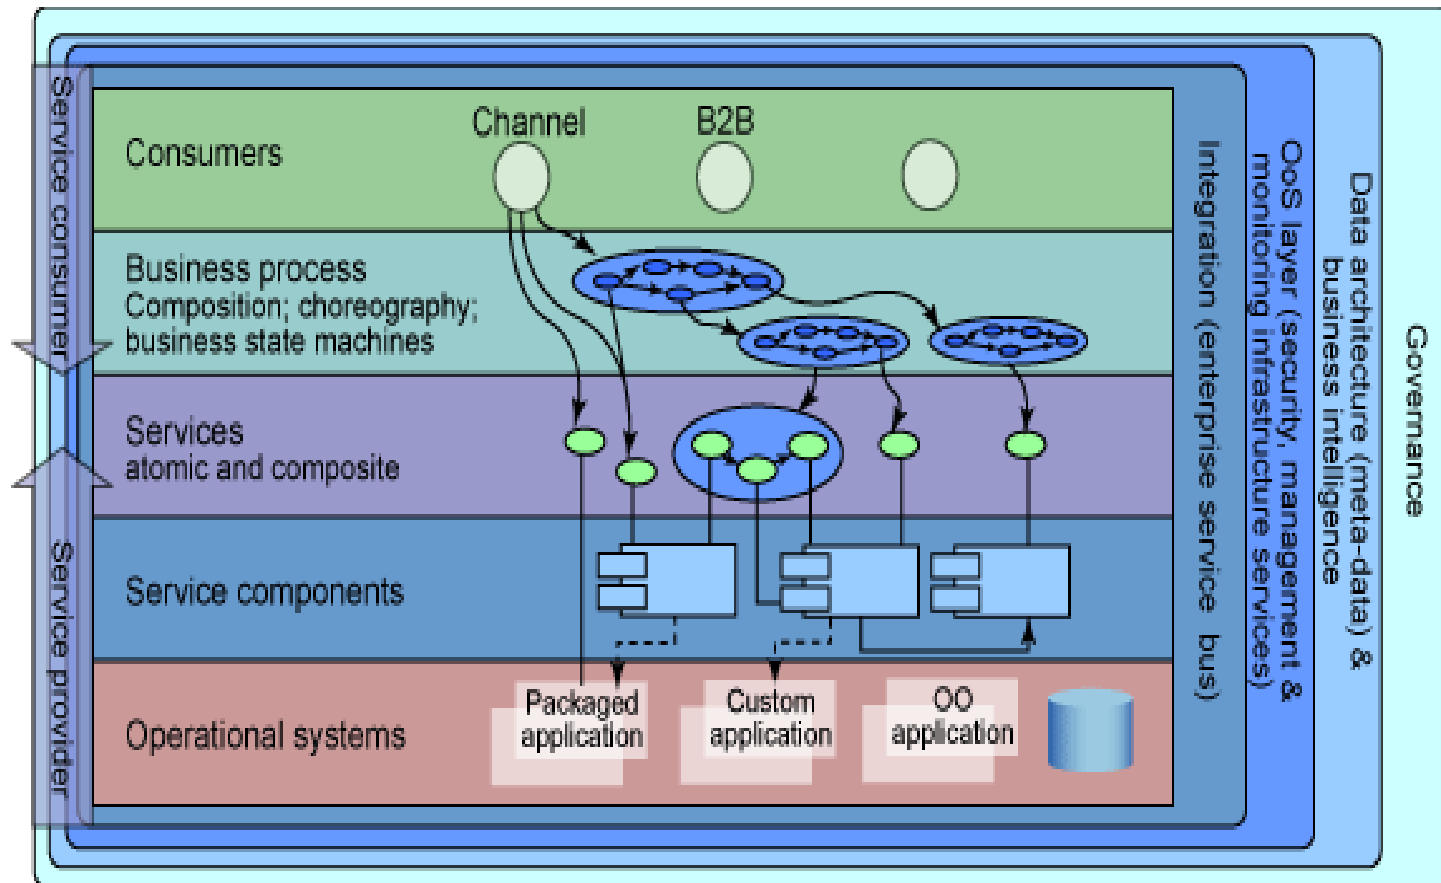

***Corollary 3: Integration of Physical Parts: Integrate design features into a single physical process, device, scientific concept, or system when FRs can be independently satisfied in the proposed solution.***

***Corollary 4: Use of Standardization: Use standardized or interchangeable parts, architecture, process, device, or system if the use of these parts, architecture, process, device, or system is consistent with the FRs and constraints. This corollary establishes the governance model for designing any large-scale system.***

***THEOREM M2 (Large System with Several Subunits) When a large (e.g., organization) consists of several subunits, each unit must satisfy independent subsets of FRs so as to eliminate the possibility of creating a resource-intensive system or a coupled design for the entire system.***

# Mission

## Mission Statement and Endstate

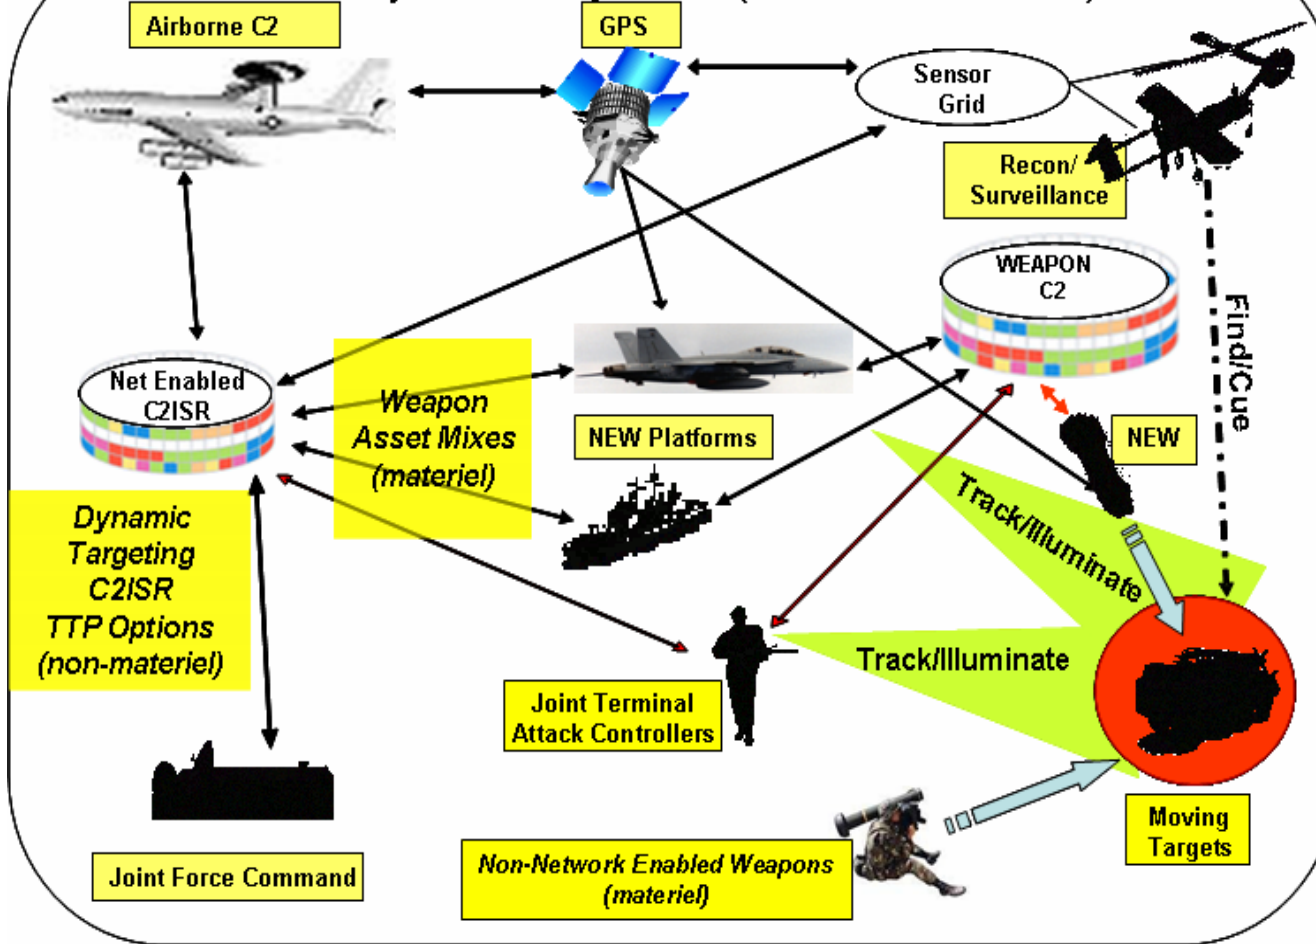

Blue Force conducts joint forcible entry operations to engage and defeat Disparate forces in order to restore Green's international border and establish regional stability

## Desired Effects:

- Reduce Disparate combat effectiveness
- Enhance Blue combat effectiveness
- Seize and control Green terrain
- Minimize collateral damage

to help achieve

## NEW System of Systems (across DOTMLPF)

## Tasks

### CAS

provides the ability to perform

Joint Network Enabled Weapon (NEW) Capability Operational Concept Graphic (OV-1), Depicting the ISR "Fuse" (Composite Task) [DODAF Version 1.5, Volume II April 2007.]

**Using THEOREM 2 and Corollary 4 ( the governance model), define the DOD Enterprise Level business processes and warfighter processes (see previous slide). The governance model is critical to eliminate departmentalized services (a critical ingredient for C4ISR SoS), such as below. Use Corollary 4 to achieve standardized processes throughout the C4ISR ecosystem. Use AXIOMS 1 & 2, Corollaries 1, 2, & 3, information content, to deign and evaluate the performance of the integrated C4ISR SoS.**

# SUMMARY OF QUEUING MODELS FOR FUTURISTIC NET-CENTRIC SOS

## Equation 18

$$T = \frac{1}{\sigma_z} \left\{ \prod_{r=1}^{\text{deg}_z} (1 - K_r) \right\}^{\omega_r} + \sum_{i=1}^o \frac{\lambda_i}{\gamma} \left[ \frac{\frac{\lambda_i}{\mu' F_i}}{\mu' F_i - \lambda_i} + \frac{1}{\mu F_i} + \frac{L_i}{SP} + \frac{1}{\sigma_z} \left\{ \prod_{r=1}^{\text{deg}_z} (1 - K_r) \right\}^{\omega_r} \right]$$

$$g(C) = \frac{e^{a + bC}}{1 + e^{a + bC}} \quad \text{Equation 19}$$

$$T_C = \frac{T}{1 - g(C)} \quad \text{Equation 20}$$

# **SERVICE-BASED SIMULATION MODELS AND EXPERIMENTAL TESTS**

- Construct the Service-based Modeling and Simulation, Before Building a Prototype
- Use Organizational Simulation Concepts, Proposed by Rouse Et Al. [Rouse Et Al. 2005] to Capture Cognitive and Social Behaviors
- Use Meta-model Approach to Represent and Simulate Organizational Entities and the Relationships Among the Entities for the Service-based C4ISR SoS
- From the Service- Based Model, Use Intelligent Distributed Multi-agent-based System to Create Symmetric or Asymmetric Threat Tactics; Generate Behavior in a Simulation-based Training Environment; And Study the Effect of Information Overload on the Network Infrastructure (Equation 20), and the Cognitive and Social Behaviors of the Friendly Adversary and the Foes. Using Equation 20 and Design Navigation Method, Predict the Network Performance.
- To Create an Adaptive Network, We Can Use Corollary 1, and Use the Multi-agent Agent System to Dynamically Adjust the Network to Respond to Uncertainties Due to Information Overload. Using Corollary 1 to Design Intelligent Decouplers [Black 1991, Nyamekye 2005] That Can Provide Extra Bandwidths in the Network, Will Reduce Information Overload, and Thus Permit the Network to Dynamically Adjust Itself to Uncertainties.

In a virtualized network (intelligent decoupled network, Corollary 1), multiple *virtual networks* co-exist on top of a shared *substrate*. Different virtual networks provide alternate end-to-end packet delivery systems and may use different protocols and packet formats. Virtual networks are implemented by *virtual routers*, connected by *virtual links*.

<http://www.arl.wustl.edu/netv/main.html>

# SUMMARY AND FUTURE POTENTIAL CAPABILITIES

The paper has discussed information content for adaptive network performance for C4ISR systems-of-systems using queuing theory and axiomatic design approach. Recent work by National Research Council (NRC) concludes that network research is an emerging scientific field. In fact, the definition of the technical terms for the network science is still unclear. Compounding this issue is the fact that the fundamental knowledge of networks is still primitive. Thus, the paper first discusses the network types and network classifications. Drawing on the previous author's work, the paper emphasizes that the axiomatic design, integrated with Service-Oriented Architecture-Based Department of Defense Architecture Framework (SOA)-Based DODAF, establishes the scientific framework for designing integrated C4ISR systems-of-systems (SOS), of which the network infrastructure is a subsystem. Borrowing Kleinrock's work on ARPANET, the detailed queuing models have been presented for the network performance. Furthermore, the information content from AXIOM 2 of axiomatic design is employed for the network optimization, including the effect of information overload, on the network performance for the Net-Centric SOS. The paper discusses that the Service-based simulation and experimental tests are needed to provide the data for the queuing models for network performance and optimization of the C4ISR SOS. The Design Navigation Method, proposed by Nakazawa has been discussed for experimental and simulation design, and for optimization, under scenarios of multi-functional requirements (FRs) and interaction effects among the design parameters (DPs). Using Corollary 1 to design intelligent decouplers that can provide extra bandwidths in the network, will reduce information overload, and thus permit the network to dynamically adjust itself to uncertainties. Such an integrated queuing modeling and axiomatic design approach, is critical for not only designing and operating complex civil-military endeavors, but also it is critical for creating a test bed for designing information-based distributed enterprise systems for counter-terrorism and natural disasters such as Katrina for the Department of Homeland Security. The paper also establishes the scientific framework for research and development in cognitive and social domains for the individual, unit, and organizational behavior within the context of complex network environments.
